### AdaBoost

MACHINE LEARNING WITH TREE-BASED MODELS IN PYTHON

Elie Kawerk

Data Scientist

#### Boosting

- Boosting: Ensemble method combining several weak learners to form a strong learner.
- Weak learner: Model doing slightly better than random guessing.
- Example of weak learner: Decision stump (CART whose maximum depth is 1).

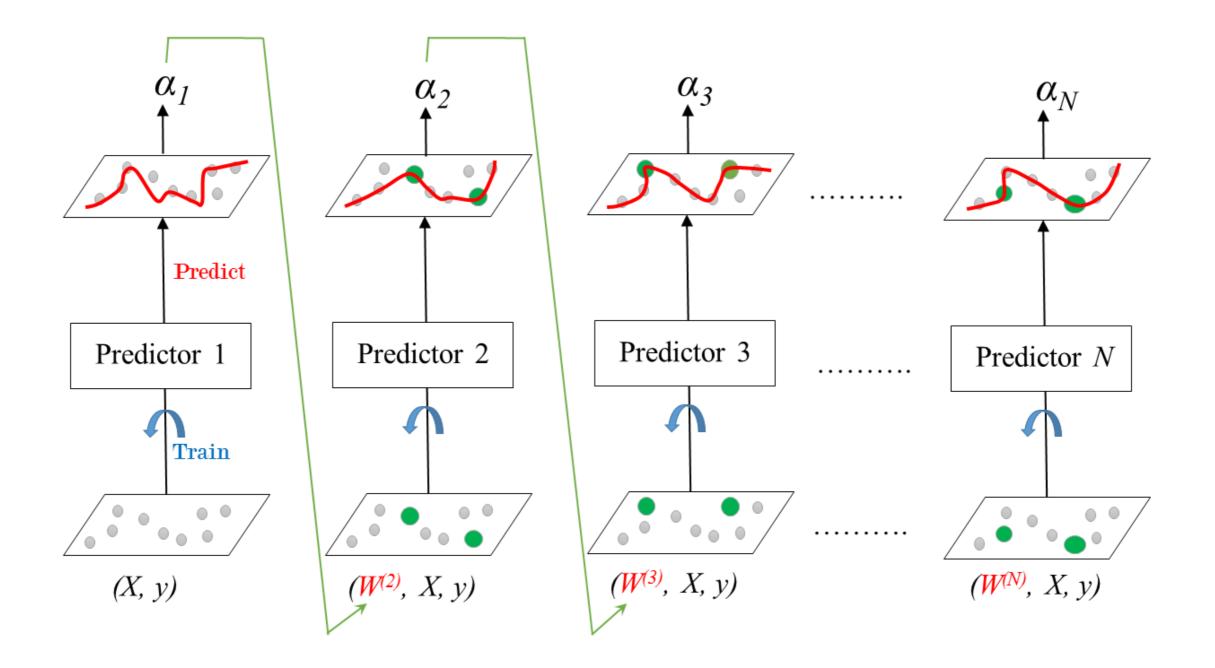

#### Boosting

- Train an ensemble of predictors sequentially.
- Each predictor tries to correct its predecessor.
- Most popular boosting methods:
  - AdaBoost,
  - Gradient Boosting.

#### Adaboost

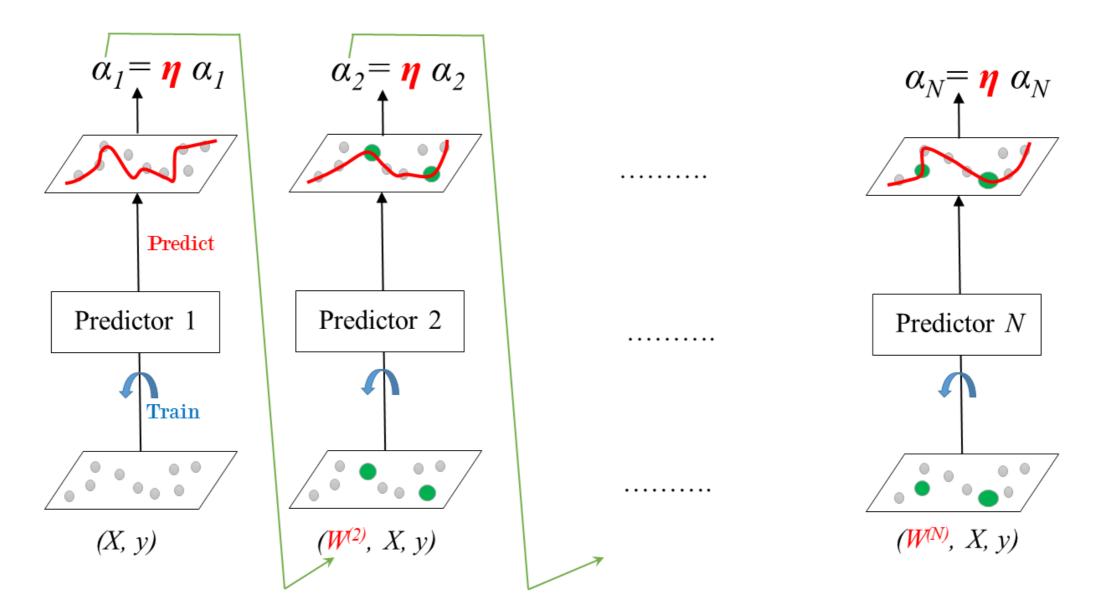

- Stands for Adaptive Boosting.
- Each predictor pays more attention to the instances wrongly predicted by its predecessor.
- Achieved by changing the weights of training instances.
- Each predictor is assigned a coefficient  $\alpha$ .
- $\alpha$  depends on the predictor's training error.

#### AdaBoost: Training

#### **Learning Rate**

Learning rate:  $0 < \eta \leq 1$ 

#### AdaBoost: Prediction

- Classification:
  - Weighted majority voting.
  - In sklearn: AdaBoostClassifier .
- Regression:
  - Weighted average.
  - In sklearn: AdaBoostRegressor .

# AdaBoost Classification in sklearn (Breast Cancer dataset)

```
# Import models and utility functions
from sklearn.ensemble import AdaBoostClassifier
from sklearn.tree import DecisionTreeClassifier
from sklearn.metrics import roc_auc_score
from sklearn.model_selection import train_test_split
# Set seed for reproducibility
SEED = 1
# Split data into 70% train and 30% test
X_train, X_test, y_train, y_test = train_test_split(X, y, test_size=0.3,
                                                    stratify=y,
                                                     random_state=SEED)
```

```
# Instantiate a classification-tree 'dt'
dt = DecisionTreeClassifier(max_depth=1, random_state=SEED)
# Instantiate an AdaBoost classifier 'adab_clf'
adb_clf = AdaBoostClassifier(base_estimator=dt, n_estimators=100)
# Fit 'adb_clf' to the training set
adb_clf.fit(X_train, y_train)
# Predict the test set probabilities of positive class
y_pred_proba = adb_clf.predict_proba(X_test)[:,1]
# Evaluate test-set roc_auc_score
adb_clf_roc_auc_score = roc_auc_score(y_test, y_pred_proba)
```

# AdaBoost Classification in sklearn (Breast Cancer dataset)

```
# Print adb_clf_roc_auc_score
print('ROC AUC score: {:.2f}'.format(adb_clf_roc_auc_score))
```

ROC AUC score: 0.99

# Gradient Boosting (GB)

MACHINE LEARNING WITH TREE-BASED MODELS IN PYTHON

Elie Kawerk

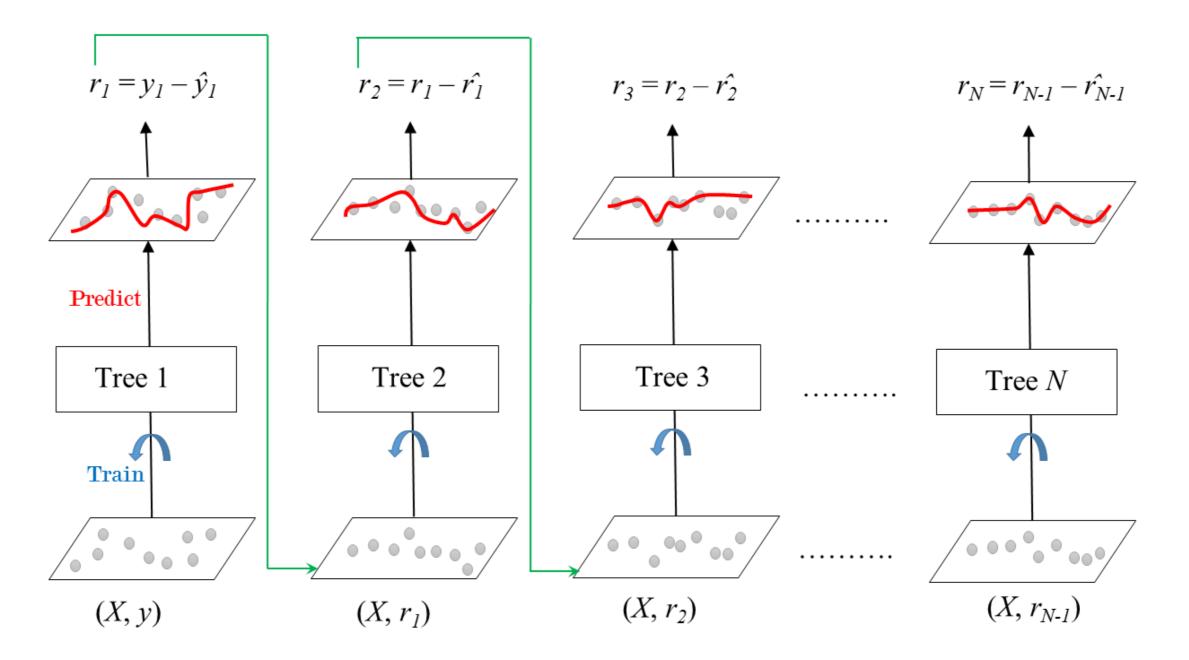

Data Scientist

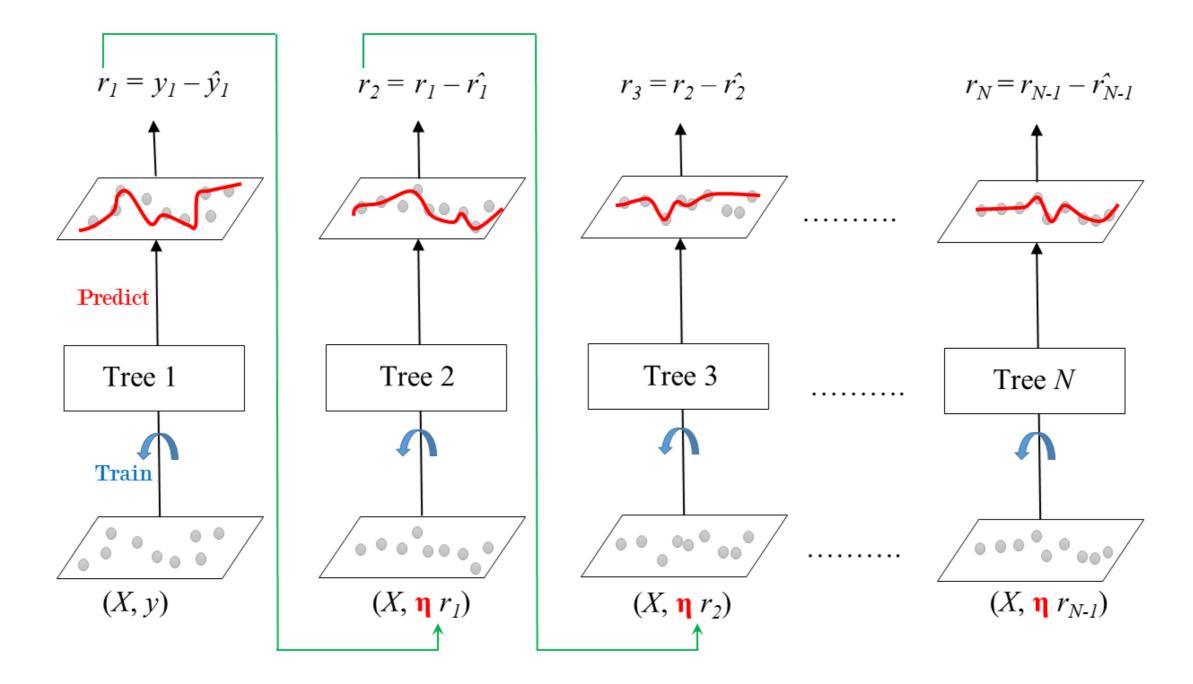

#### **Gradient Boosted Trees**

- Sequential correction of predecessor's errors.
- Does not tweak the weights of training instances.
- Fit each predictor is trained using its predecessor's residual errors as labels.
- Gradient Boosted Trees: a CART is used as a base learner.

#### **Gradient Boosted Trees for Regression: Training**

#### Shrinkage

#### **Gradient Boosted Trees: Prediction**

- Regression:
  - $\circ\quad y_{pred}=y_1+\eta r_1+...+\eta r_N$
  - In sklearn: GradientBoostingRegressor .
- Classification:
  - In sklearn: GradientBoostingClassifier .

#### Gradient Boosting in sklearn (auto dataset)

```
# Import models and utility functions
from sklearn.ensemble import GradientBoostingRegressor
from sklearn.model_selection import train_test_split
from sklearn.metrics import mean_squared_error as MSE
# Set seed for reproducibility
SEED = 1
# Split dataset into 70% train and 30% test
X_train, X_test, y_train, y_test = train_test_split(X,y,
                                                    test_size=0.3,
                                                     random_state=SEED)
```

```
# Instantiate a GradientBoostingRegressor 'gbt'
gbt = GradientBoostingRegressor(n_estimators=300, max_depth=1, random_state=SEED)
# Fit 'gbt' to the training set
gbt.fit(X_train, y_train)
# Predict the test set labels
y_pred = gbt.predict(X_test)
# Evaluate the test set RMSE
rmse\_test = MSE(y\_test, y\_pred)**(1/2)
# Print the test set RMSE
print('Test set RMSE: {:.2f}'.format(rmse_test))
```

Test set RMSE: 4.01

MACHINE LEARNING WITH TREE-BASED MODELS IN PYTHON

# Stochastic Gradient Boosting (SGB)

MACHINE LEARNING WITH TREE-BASED MODELS IN PYTHON

Elie Kawerk

Data Scientist

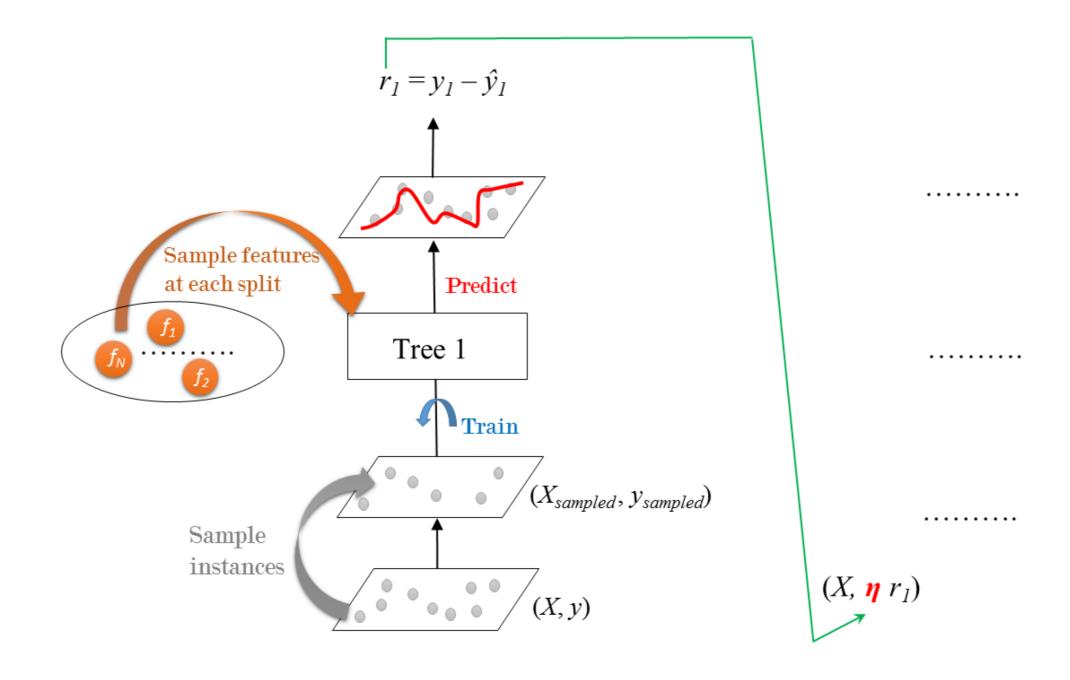

#### **Gradient Boosting: Cons**

- GB involves an exhaustive search procedure.
- Each CART is trained to find the best split points and features.
- May lead to CARTs using the same split points and maybe the same features.

#### **Stochastic Gradient Boosting**

- Each tree is trained on a random subset of rows of the training data.
- The sampled instances (40%-80% of the training set) are sampled without replacement.
- Features are sampled (without replacement) when choosing split points.
- Result: further ensemble diversity.
- Effect: adding further variance to the ensemble of trees.

#### Stochastic Gradient Boosting: Training

# Stochastic Gradient Boosting in sklearn (autodataset)

```
# Import models and utility functions
from sklearn.ensemble import GradientBoostingRegressor
from sklearn.model_selection import train_test_split
from sklearn.metrics import mean_squared_error as MSE
# Set seed for reproducibility
SEED = 1
# Split dataset into 70% train and 30% test
X_train, X_test, y_train, y_test = train_test_split(X,y,
                                                    test_size=0.3,
                                                     random_state=SEED)
```

# Stochastic Gradient Boosting in sklearn (autodataset)

```
# Instantiate a stochastic GradientBoostingRegressor 'sgbt'
sgbt = GradientBoostingRegressor(max_depth=1,
                                  subsample=0.8,
                                 max_features=0.2,
                                 n_estimators=300,
                                  random_state=SEED)
# Fit 'sgbt' to the training set
sgbt.fit(X_train, y_train)
# Predict the test set labels
y_pred = sgbt.predict(X_test)
```

# Stochastic Gradient Boosting in sklearn (autodataset)

```
# Evaluate test set RMSE 'rmse_test'
rmse_test = MSE(y_test, y_pred)**(1/2)

# Print 'rmse_test'
print('Test set RMSE: {:.2f}'.format(rmse_test))
```

Test set RMSE: 3.95
